1. INTRODUCTION 1
   1.1 Coal, Acid Mine Drainage and Fly Ash 1
2. LITERATURE REVIEW 4
   2.1 Arsenic 4
   2.2 Arsenate resistance system (ars) operons 7
   2.3 The ars operon proteins 9
3. MATERIALS AND METHODS 23
   3.1 Chemical and Reagents 23
   3.2 Bacterial strains, plasmids and media 23
   3.3 Sampling and culturing 25
   3.4 Phenotypic characterization 26
   3.5 Genomic DNA extraction 26
   3.6 Genomic DNA purification and precipitation 26
   3.7 Polymerase Chain Reaction (PCR) with universal primers 27
   3.8 Agarose gel electrophoresis 27
   3.9 Cloning (ligation, transformation and colony selection) 28
   3.10 BLAST program and phylogenetic tree 28
   3.11 Restriction endonuclease digestion 28
   3.12 Partial digestion of genomic DNA 29
   3.13 Dephosphorylation of DNA 29
   3.14 DNA ligation 29
   3.15 Electrocompetent cells 30

3.16 Transformation 30
3.17 Construction of the genebank 31
3.18 Plasmid DNA extraction 31
3.19 Arsenic resistance system (ars) screening of library 32
3.20 Blunt Ending DNA fragments 32
3.21 Cloning and Subcloning 32
3.22 Determination of arsenic resistance 33
3.23 DNA sequencing 33
3.24 Computational techniques 33
4. RESULTS 35
4.1 Culturing arsenic resistant strains and phenotypic characterisation 35
4.2 Basic tests of isolates 35
4.3 16S rRNA gene PCR 35
4.4 16S rRNA gene sequence analysis of the two isolates 37
4.5 Cloning and sequencing analysis of the arsenic resistance encoding genes from *Bacillus silvestris* 39
4.6 Sequence analysis of pArs8 45
4.7 Arsenic growth assays 59
5. DISCUSSION 61
6. CONCLUSIONS 67
7. RECOMMENDATIONS 68
8. REFERENCES 69

Appendix 1 76
