

TABLE OF CONTENTS

EXECUTIVE SUMMARY	i
ACKNOWLEDGEMENTS	xix
TABLE OF CONTENTS	xxi
LIST OF FIGURES	xxv
LIST OF TABLES	xxviii
1. INTRODUCTION	1-1
1.1 Project justification	1-1
1.2 Background	1-3
1.3 Project objectives	1-4
1.4 Report layout	1-5
2. LITERATURE REVIEW	2-1
2.1 Environmental impacts associated with coal mining in South Africa ..	2-1
2.1.1 Impacts on groundwater resources	2-2
2.1.2 Impacts on surface water resources	2-3
2.2 Acid drainage and salinisation	2-4
2.2.1 Acid drainage	2-4
2.2.2 Salinisation	2-5
2.2.3 Mitigation strategies to control acid drainage processes	2-6
2.3 Current rehabilitation practices	2-8
2.3.1 South African guidelines	2-8
2.3.2 Rehabilitation practices in other countries	2-9
2.4 Risk assessment	2-11
2.5 Final cover systems: Functions & Classification	2-12
2.5.1 Provide growth medium	2-14
2.5.2 Limit water infiltration	2-15
2.5.3 Impede acid drainage processes	2-19
2.6 Vegetation covers	2-25
2.7 Low-permeability barriers	2-29
2.7.1 Topsoil layer	2-31
2.7.2 Protection layer	2-31
2.7.3 Drainage layer	2-32
2.7.4 Infiltration barrier	2-34
2.7.5 Capillary break or gas collection layer	2-40
2.8 Store-and-release covers	2-41
2.8.1 The capillary break concept	2-42
2.8.2 Material selection and design of store and release covers	2-47
2.9 Capillary barrier systems	2-49
2.9.1 The capillary barrier concept	2-51
2.10 Wet cover systems	2-54
2.10.1 Effectiveness of oxygen barriers	2-56
2.10.2 Material selection and wet cover design	2-59
2.11 Soil cover design and construction	2-60
2.11.1 Construction quality assurance	2-60
2.11.2 Soil cover degradation	2-62
2.12 Soil cover designs and performances overview	2-63

2.12.1	Continental climates.....	2-65
2.12.2	Temperate climates.....	2-69
2.12.3	Tropical climates.....	2-72
2.12.4	Semi arid climates.....	2-73
2.12.5	Arid climates.....	2-75
3.	UNSATURATED FLOW MODELLING THEORY	3-1
3.1	Introduction.....	3-1
3.2	Conceptual unsaturated flow model	3-1
3.3	Atmospheric coupling.....	3-3
3.3.1	Infiltration.....	3-3
3.3.2	Reference evaporation.....	3-5
3.3.3	Actual evaporation	3-8
3.3.4	Actual transpiration	3-9
3.4	Unsaturated flow	3-12
3.4.1	Soil-water characteristic curves.....	3-13
3.4.2	Steady-state saturated flow.....	3-15
3.4.3	Unsaturated flow	3-15
3.4.4	Transient flow of water through unsaturated soils.....	3-16
3.5	Developments of unsaturated flow theory	3-19
3.5.1	Unsaturated flow modelling.....	3-19
4.	EXPERIMENTAL SET-UP.....	4-1
4.1	Introduction.....	4-1
4.2	Physical cell construction	4-2
4.2.1	Vegetation of the cells.....	4-5
4.3	Instrumentation.....	4-7
4.3.1	Tipping buckets	4-8
4.3.2	Weather station.....	4-9
4.3.3	Neutron probe	4-11
4.3.4	Gas analyser	4-11
4.3.5	Soil moisture probes	4-11
4.3.6	Soil temperature probes.....	4-13
4.4	Monitoring programme	4-13
4.4.1	Problems encountered during the monitoring period	4-15
4.4.2	Data analysis.....	4-16
4.5	Properties of the fine coal discard and cover soils	4-17
4.5.1	Physical properties.....	4-17
4.5.2	Hydraulic properties	4-19
4.5.3	Chemical properties	4-26
5.	MONITORING PROGRAMME RESULTS.....	5-1
5.1	Climatic characteristics.....	5-1
5.2	Meteorological results	5-2
5.2.1	Rainfall.....	5-4
5.2.2	Evaporation.....	5-6
5.2.3	Temperature.....	5-8
5.2.4	Relative humidity.....	5-10
5.2.5	Net radiation.....	5-11
5.2.6	Wind speed and direction.....	5-13

5.3	Volumetric water content.....	5-14
5.4	Outflow analyses.....	5-18
5.4.1	Uncovered cells (Cells 1, 2 and 3).....	5-21
5.4.2	Single layer covers (Cells 4 and 5).....	5-22
5.4.3	Double layer covers (Cells 6 and 8).....	5-23
5.4.4	Store & release Cover (Cell 7).....	5-25
5.4.5	Sloped covers (Cells 9 and 10).....	5-27
5.5	Oxygen and carbon dioxide concentrations.....	5-28
5.6	Water quality results.....	5-32
6.	UNSATURATED FLOW MODELLING RESULTS.....	6-1
6.1	Introduction.....	6-1
6.2	Conceptual unsaturated flow model.....	6-2
6.3	Selection of the mathematical model.....	6-3
6.4	Model set-up.....	6-4
6.5	Model calibration.....	6-6
6.6	Outflow modelling results.....	6-13
7.	LEACHATE QUALITY.....	7-1
7.1	Introduction.....	7-1
7.2	Evaluation of leachate quality trends.....	7-2
7.2.1	Time series and statistical evaluation.....	7-2
7.2.2	Acid rock drainage (ARD) potential evaluation.....	7-4
7.2.3	Evaluation of onset of acidic drainage.....	7-5
7.3	Oxygen ingress and its relationship with leachate quality.....	7-15
7.4	Discussion of results.....	7-17
8.	FRAMEWORK FOR THE DEVELOPMENT OF A COVER ASSESSMENT SOFTWARE PROGRAM.....	8-1
8.1	Introduction.....	8-1
8.2	Development approach.....	8-2
8.2.1	Development methodology.....	8-3
8.3	Program layout.....	8-4
9.	DISCUSSION, CONCLUSIONS AND RECOMMENDATIONS.....	9-1
9.1	Discussion.....	9-1
9.1.1	Reduction of waste loads.....	9-2
9.1.2	Estimated acid breakthrough periods.....	9-4
9.1.3	Extrapolation of results to Mpumalanga coal mines.....	9-6
9.1.4	Assessing the performance of existing soil covers.....	9-7
9.1.5	Agricultural and economic impacts.....	9-7
9.1.6	Use of power station fly ash in cover design.....	9-7
9.1.7	Appropriateness of soil covers.....	9-8
9.1.8	Assessment of soil covers by means of numerical models.....	9-9
9.2	Conclusions.....	9-9
9.2.1	Outflow results.....	9-9
9.2.2	Modelling results.....	9-10
9.2.3	Oxygen and leachate quality results.....	9-11
9.3	Recommendations.....	9-12
9.3.1	Further research.....	9-12

9.3.2	Monitoring the performance of soil covers	9-13
9.3.3	Procedures for designing soil covers	9-15
10.	REFERENCES	10-1

APPENDICES

Appendix A: Photographs of construction, instruments and vegetation cover

Appendix B: Model climate data files

Appendix C: Leachate data and time series plots
