

TABLE OF CONTENTS

1 General introduction	1
1.1 Acid rock drainage	1
1.1.1 Generation of acid rock drainage	1
1.1.2 Effects on human health	3
1.1.3 Effects on the environment	3
1.2 Treatment technologies	4
1.2.1 Active treatment technologies	4
1.2.2 Passive treatment technologies	4
1.3 The biological sulphur cycle	5
1.3.1 Chemical sulphide oxidation	6
Ratio of sulphide to oxygen	6
Influence of pH	6
Influence of temperature	7
1.3.2 Biological sulphide oxidation	7
Microbial contribution to the biological sulphur cycle	7
Ratio of sulphide to oxygen	8
Influence of pH	9
Influence of temperature	9
Effect of chemical sulphide oxidation on biological sulphide oxidation	9
Polysulphide formation and its impact on sulphide oxidation	9
Redox potential	10
1.4 Biofilms	11
1.4.1 Biofilm structure	11
1.4.2 Floating biofilms	11
1.4.3 Mass transport and mass transfer limitations	11
2 Aims and objectives	13
2.1 Project terms of reference	13
2.2 Deliverable 3 terms of reference	13
3 Materials and methods	14
3.1 LFCR studies	14
3.1.1 Integrated system setup and operation	14
3.1.2 LFCR reactor tests	14
3.1.3 Determination of kinetic parameters	16
3.2 Organic carbon flux and impact of molasses supplementation	17
3.2.1 Analysis of VFA content in DPBR overflow	17
3.2.2 Determination of COD value of molasses	17
3.2.3 Batch sulphate reduction tests	17
4 Results and discussion	19
4.1 Abiotic control LFCRs	19
4.1.1 No pH control	19
4.1.2 pH controlled system	19
4.2 Biological LFCRs	20
4.2.1 LFCR 1 – limited biofilm formation	20
4.2.2 LFCR 2 – partial biofilm formation	23
4.2.3 LFCR 3 - complete biofilm formation	25
4.3 Determination of sulphide oxidation kinetics in bulk phase as a function of time	25
4.4 Organic carbon flux and impact of molasses supplementation	28
4.4.1 Effect of molasses feed concentration on DPBR performance	28
4.4.2 Batch flask tests	30
5 Conclusion and implications for plant operation	33
6 References	34
